

Recombinant *Borrelia Burgdorferi* Sensu Stricto Decorin-binding protein A (DbpA) [GST] (DAG-WT320)

This product is for research use only and is not intended for diagnostic use.

PRODUCT INFORMATION

Antigen Description	The full length of <i>Borrelia burgdorferi</i> sensu stricto decorin-binding protein A (amino acids 1 – 191) is expressed with Glutathione S-Transferase in <i>E. coli</i> .
Purity	> 80% , as determined by SDS-PAGE
Conjugate	GST
Applications	ELISA/LF
Molecular Weight	46.8 kDa
Format	Liquid
Concentration	Batch dependent - please inquire should you have specific requirements
Size	1 mg
Buffer	PBS, pH 7.4
Preservative	None
Storage	Store at -80°C. Avoid multiple freeze/thaw cycles.

BACKGROUND

Introduction	<i>Borrelia burgdorferi</i> are bacterial species of the spirochete class in the genus <i>Borrelia</i> , some of which cause Lyme borreliosis (also known as Lyme disease) in humans. The name <i>Borrelia</i>
---------------------	--

burgdorferi refers to two different concepts: *B. burgdorferi* sensu stricto is a specific bacterial genospecies and *B. burgdorferi* sensu lato is the species complex containing the etiological agents of Lyme disease. The complex currently comprises 20 accepted and 3 proposed genospecies. *B. burgdorferi* sensu stricto exists in North America and Eurasia and until 2016 was the only known cause of Lyme disease in North America (*Borrelia mayonii*, found in the midwestern US, and *B. bissettiae* are also known to cause the disease).
