

Anti-Human IgG Fc monoclonal antibody, clone IQ7054 [DyLight® 488] (DMAB17343)

This product is for research use only and is not intended for diagnostic use.

PRODUCT INFORMATION

| | |
|---------------------------|--|
| Product Overview | Mouse Anti-IgG Monoclonal Antibody |
| Specificity | Mouse Anti-Human IgG Fc Specific recognizes an epitope on Human IgG Fc Specific. This monoclonal antibody was purified using multi-step affinity chromatography methods such as Protein A or G depending on the species and isotype. Antigen Distribution: Surfa |
| Target | IgG |
| Immunogen | Purified Recombinant Human IgG Fc Specific (>98%) |
| Isotype | IgG2b |
| Source/Host | Mouse |
| Species Reactivity | Human |
| Clone | IQ7054 |
| Conjugate | Dylight 488 |
| Applications | FC |
| Format | This DyLight 488 conjugate is formulated in 0.01 M phosphate buffered saline (PBS) pH 7.4, 150 mM NaCl, 1% BSA and 0.09% sodium azide as a preservative. |
| Concentration | 0.1 mg/ml |
| Size | 100 µg |
| Preservative | 0.09% Sodium Azide |

Storage

This DyLight488 conjugate is stable when stored at 2-8°C. Do not freeze.

BACKGROUND

Introduction

Immunoglobulins belong to a group of related glyco proteins which make up 20% of serum proteins. Antigens and immunoglobulins react to confer immunity to individuals. Immunoglobulins have similar structures of two identical heavy chains and two identical light chains. Both the heavy chains and the light chains are divided into constant and variable regions. The constant regions have the same amino acid sequences between all the immunoglobulin classes. The variable regions have approximately 110 amino acids with high sequence variability. The amino acid sequence of the heavy chain determines the class of an immunoglobulin. The five types of immunoglobulin heavy chains are known as: IgG, IgA, IgM, IgD, and IgE. IgG is divided into four subclasses, and IgA is divided into two subclasses. In serum IgA and IgG are monomers with a single 4 polypeptide unit; while, IgM is a pentamer. IgA may also form polymers. Kappa light chain antibody can be used for the identification of leukemias, plasmacytomas and certain non Hodgkin's lymphomas. Kappa light chain contains one immunoglobulin like domain. The EU sequence has the INV allotypic marker, Ala 45 and Val 83. The ROY sequence has the INV allotypic marker, Ala 45 and Leu 83.
