BACKGROUND

Introduction	Severe acute respiratory syndrome coronavirus 2 (SARS-CoV2) is comprised of a large single stranded positive polarity RNA genome that acts as messenger RNA after entering the host. Post infection, the ssRNA encodes two

open reading frames, produced through host ribosomal frameshifting that transcribes two polyprotein products. The polyprotein products are subsequently cleaved into 27 viral proteins by internally encoded proteases. Further processing of the polyprotein releases an RNA-polymerase along with several non-structural proteins that facilitate RNA synthesis and may play a role in the enveloping process but are not included in the viral coat.
