

Newcastle disease virus positive serum (DAGF-105)

This product is for research use only and is not intended for diagnostic use.

PRODUCT INFORMATION

Antigen Description	Newcastle disease (ND) is one of the highly pathogenic viral diseases of avian species. ND is economically significant because of the huge mortality and morbidity associated with it. The disease is endemic in many third world countries where agriculture serves as the primary source of national income. Newcastle disease virus (NDV) belongs to the family Paramyxoviridae and is well characterized member among the avian paramyxovirus serotypes.
