

Rotavirus Positive Sample (DAG-H10377)

This product is for research use only and is not intended for diagnostic use.

PRODUCT INFORMATION

Antigen Description	This product contains inactivated rotavirus in storage buffer.
Nature	Native
Expression System	N/A
Species	Rotavirus
Conjugate	Unconjugated
Preparation	A cellular monolayer of MA104 cells is infected with Rotavirus particles. Cell culture lysate is harvested and clarified.
Procedure	None
Preservative	None
Storage	Store this preparation at 2°C to 8°C.

BACKGROUND

Introduction Rotavirus is the most common cause of severe diarrhea among infants and young children. It is a genus of double-stranded RNA virus in the family Reoviridae. Nearly every child in the world has been infected with rotavirus at least once by the age of five. Immunity develops with each infection, so subsequent infections are less severe; adults are rarely affected. There are five species of this virus, referred to as A, B, C, D, and E. Rotavirus A, the most common species, causes more than 90% of rotavirus infections in humans.
